# VARONIS COMPARATIVE BRIEF: CODE42 SHAREPLAN

OVERVIEW

Code42 Shareplan is a file sharing and sync product for enterprise environments. It offers on premise and cloud deployments and both require that the file shares be migrated to Code42's Shareplan designated storage. Once deployed, users can configure "Share Plans" to determine which data will be synchronized and users then add members to the plan and files to be shared. The files are then synced between the members of the Share Plan. User authentication is provided through AD or LDAP. Code42 also offers the ability to send internal and external links, supports Android/iOS apps for mobile access, and remote wipe for mobile devices. Like DatAnywhere, Code42 Shareplan also integrates with Windows Explorer so that users can access their Shareplan files from their desktop.

Although Code42 Shareplan and DatAnywhere have some similarities, one key distinction is that Shareplan is not able to enable data-in-place for sharing and syncing. Unlike DatAnywhere, Shareplan requires data to be migrated to Shareplan designated storage before it can be enabled for sharing and syncing between users. Therefore Shareplan is unable to utilized existing file share permissions, and multiple versions of files may exist outside of Shareplan storage. DatAnywhere allows organizations to sync data in-place and therefore can leverage the existing permissions and maintain a definitive versions of documents.

BULLET POINTS

⚙ Does not allow for sharing and syncing of data in-place, must be migrated to Shareplan designated storage.

⚙ Does not leverage existing permissions.

⚙ Multiple versions of documents may exist due to storage migration requirement.

VARONIS DatAnywhere vs. Code42 Shareplan

	DatAnywhere	Code42 Shareplan
Use your existing file sharing infrastructure	10	0
Keep data on your existing file servers	10	0
Keep your existing permissions	10	0
No data migration required	10	0
Authenticate with AD or LDAP	10	10
