Cloud & Automation
Smart Strategies for Today's Modern Enterprise

Leveraging the cloud can bring big benefits… but getting there without the right expertise can be daunting

Let cStor guide your cloud development, implementation and automation with ease.

Cloud is no longer a buzz word, it's an imperative for today's successful organization. Whether you're working to improve the user experience, keep business running smoothly around the clock, mitigate risk, reduce costs or all of the above, cloud and automation solutions are delivering on the promise of adding ROI and value to the business. Yet the explosion of cloud-based systems has—in many cases—traded management complexity for administrative complexity, putting new pressure on IT organizations to improve business performance without compromising system availability or security. With so much complexity, even the most advanced IT teams need a trusted partner to help them maximize all of the benefits the cloud has to bring.

Rapid access to flexible, scalable IT resources.

Whether you're running applications for a few, a few hundred or thousands of users, the cloud means rapid access to flexible, scalable resources that can improve business efficiency, streamline operations and deliver the right resources, at the right time.

Cloud Quick Facts.* Is Your Business Ready?

- 75% of businesses report that service availability improved since moving to the cloud.
- 3 out of 4 IT decision makers use cloud services.
- 94% of managers say their business security has improved after adopting cloud applications.
- Business agility and scalability are the top two business drivers for moving to the cloud.
- Cloud computing spending is expected to reach $183 billion in 2015.

Cloud and Automation Benefits

Improve economies of scale. Only pay for what you consume and seamlessly scale up or down as computing needs evolve.

Increase speed and agility. Launch new IT resources and services in minutes rather than hours, days or longer with nearly instant system access for your users.

Improve capacity predictability. Get a clear grasp of resourcing needs across users, applications and systems to better prepare for peaks and valleys.

Reduce hardware and software costs. Avoid the need for large capital investments and resources needed to manage infrastructure.
